

Meeting Minutes of B06

Date and Time: 2026/04/02 11:20

Location: T29-101

Present:

- t330016056 Bohan Yang
- t330026083 Xinze Li
- t330025052 Chenxu Liu
- t330026245 Ye Zuo
- t330026244 Kaiwen Zuo
- t330026219 Wenyi Zhang

Next Meeting: 2026/04/09 11:20

Agenda:

1. Review Lab 6 task briefing and confirm this week's deliverables.
2. Re-check key requirements from previous labs (state-transition/UI matching and numbering rules).
3. Plan Class Diagram work for the current partial SRS submission.
4. Plan Sequence Diagram work for the mentor use case Search Student's Info.
5. Assign responsibilities and confirm submission package and deadline.

Announcements:

The team reviewed the Lab 6 instructions released this week. The required work includes:

- Continue partial SRS refinement based on feedback.
- Prepare a **Class Diagram** with only participating classes, including key attributes and operations needed for understanding the design.
- Prepare a **Sequence Diagram** for the mentor use case **Search Student's Info** (according to Lecture 6 and Lecture 7 guidance).
- Place both diagrams in **Appendix B** of the SRS and provide proper figure labels.

The group also noted reminders from earlier feedback that still apply:

- State transition diagram states and corresponding UIs must match exactly (state number, label, and controls).
- All UIs should remain in one consolidated UI file and be organized by numbering groups (1/2/3/4).
- Avoid duplicated UI pages and inconsistent state numbering.

Submission reminder discussed in class: submit one copy of the partial SRS to iSpace and GitLab before the deadline (noon, 4 April 2026).

Discussion:

1. The group first reviewed the Lab 6 scope and agreed that this week's core focus is adding analysis/design models rather than rewriting all previous text sections.
2. For the Class Diagram, the team agreed to model only classes directly participating in current core use cases, especially around login, mentor/student information query, interview record context, and role-based access behavior. Members agreed to include only important attributes/operations for readability and completeness at this stage.
3. For the Sequence Diagram of Search Student's Info (Mentor), the group agreed on the main interaction chain: Mentor UI -> Controller/Service -> Data Access -> User/Student data source -> result return to UI. The team will ensure message order clearly reflects validation, query, and response display.
4. The group discussed consistency rules between artifacts: use case intent, transition states, UI controls, class responsibilities, and sequence messages should not conflict. This is necessary to avoid losing marks for cross-artifact inconsistency.
5. The members also agreed to reserve Reading Week time for revising Lab 5 after formal grading feedback is released, so that the team can avoid overlap pressure before the next lab meeting.
6. Responsibility allocation for this week:
 - Bohan Yang: draft and finalize Meeting Minutes 5; integrate Appendix B sections and check submission packaging.
 - Xinze Li: review SRS wording and section references; ensure figure captions and cross-references are correct.
 - Chenxu Liu: draft the Class Diagram structure and core class operations.
 - Ye Zuo: coordinate progress, verify alignment with Lab 6 slides, and conduct final pre-submission checklist.
 - Kaiwen Zuo: draft/refine Sequence Diagram for mentor Search Student's Info and verify message flow logic.
 - Wenyi Zhang: check UI/state consistency and support diagram labeling/formatting in the final document.

Any Other Business (AOB):

The group agreed to complete the class and sequence diagrams first, then run a final consistency check across Section 3, UI file, and Appendix B before submission. The team leader will remind everyone to upload finished parts early and avoid last-minute submission risk. After final confirmation, the secretary will upload this meeting minutes file to the repository.
